Project Name	BlogNest - AI-Powered Blog Management Backend
Maximum Marks	-

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Content creators struggle to manage multiple drafts, categories and tags, approvals, comment moderation and media, and lack analytics and role-based collaboration.
2	Idea / Solution description	BlogNest is a headless REST API built with Node.js, Express.js and MongoDB (Mongoose). It provides JWT authentication, role-based access (Admin, Editor, Author, Reader), a blog lifecycle (Draft, Pending Approval, Scheduled, Published), comment moderation, media metadata, tags and search, plus AI blog generation and summarization through Google Gemini.
3	Novelty / Uniqueness	Combines a traditional CMS workflow with generative AI in one backend: AI blog generation (/api/ai/generate-blog), summarization (/api/ai/summarize), FAQ assistance, with a strict permission matrix and built-in sanitization against XSS and NoSQL injection.
4	Social Impact / Customer Satisfaction	Reduces content delays and repetitive work, lets small creators produce quality content faster, keeps comment spaces safer through moderation, and gives users secure access to their own content.
5	Business Model (Revenue Model)	Subscription tiers for creators and teams; usage-based pricing for AI generation credits; premium analytics and team collaboration add-ons; API access for third-party frontends.
6	Scalability of the Solution	Modular MVC architecture with stateless JWT authentication supports horizontal scaling; MongoDB scales through indexing and sharding; AI processing is offloaded to an external service; new modules can be added without changing the core.
